Abstract— Vehicular systems administration has turned into a mainstream research zone in light of its particular gimmicks and applications, for example productive movement administration, road security and business perspectives. Vehicles are relied upon to convey generally more correspondence frameworks, ready for offices, stockpiling and expanded sensing force. Consequently, numerous advances have been sent to keep up and advance Intelligent Transportation Systems (ITS). As of late, various arrangements were proposed to address the difficulties and issues of vehicular systems. Vehicular Cloud Computing (VCC) is one of the arrangements. VCC is another engineering that has a recognizable effect on activity administration and road security by in a flash utilizing vehicular assets, for example, figuring, stockpiling and web for choice making. This paper shows the condition of the overview of secure communication in vehicular cloud computing. In addition, we exhibit a scientific categorization for vehicular cloud in which extraordinary consideration has been dedicated to the broad applications, cloud developments, key administration, protection and security issues. Through a far reaching survey of the writing, we outline building design for VCC, organize the properties needed in vehicular cloud that help this model. We contrast this system and typical Cloud Computing (CC) and talk about open exploration issues and future headings. By evaluating and examining writing, we found that VCC is an innovatively beneficial and monetarily reasonable innovative moving standard for joining canny vehicular systems towards self-ruling movement, vehicle control and recognition frameworks.

Keywords— Vehicular cloud, V2V, V2I, CBRF, VANET, RSU, CLGF

I. INTRODUCTION

Undertakings are consistently looking for another and change technique to build their income and diminish their expenses. Those creativities need distinctive innovations that let them develop and don't strain them fiscally. From the present advances, Cloud registering has risen as a promising arrangement giving on interest access to powerful figuring assets, stages, and applications in a pay-as-you-go way. Cloud administration clients can utilize what they require and pay just for what they utilize. As an aftereffect of this, Cloud processing has

raised the conveyance of IT administrations to another level that brings the solace of customary advantages, for example, water and power to its clients. There are different focal points of Cloud registering, for example, cost helpfulness, adaptability, and effortlessness of administration, empower more organizations and administration suppliers to adjust it and over their answers by means of Cloud processing models. Vehicular cloud figuring additionally expands its ubiquity. Individuals use Laptops and other cell phones to get to the administrations of cloud. So the security issue increments and the information does not stay safe the aggressor assaults the information and miss use it. So to Investigate the fresh out of the box new region and outline answers for every individual test to be specific for Authentication, Authorization, truth relationship, scalability and so on.

II. RELATED WORK

All hubs, for example, vehicles and street side bases have the capacity correspond with one another focused around the V2V or V2I correspondence models in vehicular distributed computing. Besides, the vehicles and street side bases are obliged to speak with the cloud to store or methodology their information.

Area data assumes a crucial part in VC to transmit information and make associations on the grounds that most applications in vehicular frameworks depend on area data, for example, activity status reports, impact evasion, crisis cautions, and helpful driving. In this way, the security of area data and restriction ought to be given among vehicles.

An enormous number of asset rich vehicles that are voyaging on the parkways and urban zones forces web access administrations, on-board stockpiling, high calculation and detecting abilities. In our everyday life, numerous vehicles spend a significant time in shopping centres, parking structures and drive ways. With these highlights, vehicles can be used as a cloud hub inside neighbourhood autos that are included in the cloud arrangement. In reality, the drivers may lease their vehicle's ready assets to the autos that are requesting particular administration for stipulated time period. In such circumstances, vehicles have the capacity to collaborate for the sole purpose of tackling issues that would happen in incorporated framework. For example, a driver raise the inquiry to vehicular cloud with respect to the reason for road turned parking lot in the following street portion. Because of this question, the vehicular cloud make, keep up and engender this data to the significant vehicles. Web cloud likewise can be utilized to inquiry this kind of data however at the expensed of over the top sum of time for questioning and looking data in the worldwide cloud. Therefore, vehicular distributed computing has numerous favourable circumstances when contrasted with the ordinary distributed computing. All the more essentially, vehicular mists have different critical applications going from activity wellbeing, environment detecting, data circulation to the business notice and activity infotainment. Case in point, vehicles will catch data like activity condition, street condition, autos in the region, and environment condition and observation recordings by means of prepared sensors.

III. PROPOSED WORK

VANET uses moving cars as node in network to create a mobile network which turns every participating car into a wireless router or node, allowing cars approximately 100 to 300 meters of each other to connect and, in turn, create a network with a wide range. As cars fall out of the signal range and drop out of the network, other cars can join in, connecting vehicles to one another so that a mobile Internet is created. Each VANET car communicates with the VANET base station and other VANET cars using various protocols which are within its range. VANET users vehicular mobility that take into consideration a number of

parameters such as the speed of the vehicle, number of intersections on the road etc. Small Scale VANETs Small Scale VANETs- These are compatible for small areas which are less than 1 square miles. Special routing protocols are used in these VANETs which are different than the traditional MANETs. Routing in small scale VANETs- Two routing techniques are used in small scale VANETs:- connection-based restricted forwarding (CBRF) and connectionless geographic forwarding (CLGF)

A. Proposed Schemes

1) Connection-based restricted forwarding (CBRF) : -It builds routes using a route request (RREQ)/route reply (RREP) query cycle. First RREQ packets are broadcast across the network to discover a route from the source to the destination. A node receiving an RREQ packet sends RREP packets back to the source if it has a route to the destination or is the destination itself; otherwise, it will rebroadcast the RREQ. Data packets are sent to the destination after the source node receives the RREP. The routing information is updated to ensure that the best route is chosen. If a link breaks while the route is active, a route error (RERR) message is sent to the source node. The source node may then reinitiate a route discovery process.

2) Connection-less geographic forwarding (CLGF) :- it is a location- based routing protocol that exploits the correspondence between geographic position and connectivity in a wireless network by using the positions of the nodes to make packet-forwarding decisions. However, CLGF is greedy, because it always forwards packets to nodes that are progressively closer to the destination, if such a node exists.

B) Actual Working

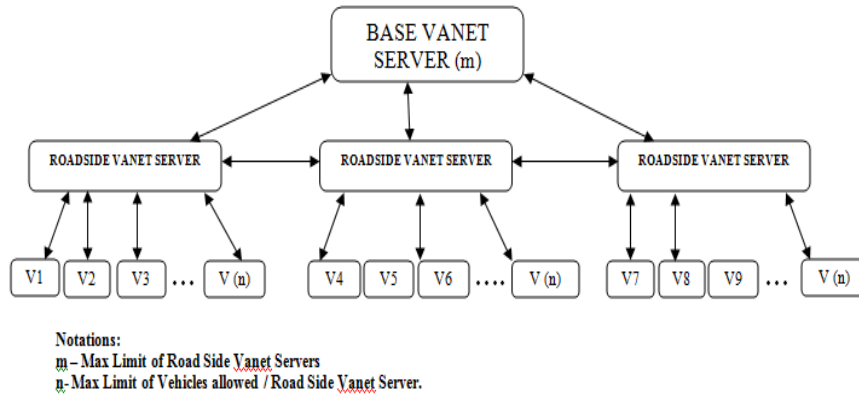

Fig 1 : Block Diagram

Connection-based restricted forwarding (CBRF)

1. There would be a Base Vanet Server (BVS) program running on a computer, responsible for communication between various Roadside Vanet Servers (RVS). This computer will hold the information of each RVS and also the no of connected vehicles to that RVS.

BVS is also responsible for suggesting the congestion less routing to vehicles from source to destination. BVS is capable of finding the congestion less routing because of the interconnection of RVS through BVS.

2. Each vehicle will be holding a unique identification number, so that once it leaves any one RVS and joins another RVS, then BVS can easily track the vehicle location based on the RVS details to which the vehicle is connected.
3. Each vehicle will also have properties like Id, Speed, Fuel Level, Driving Mode (Auto/Manual), GPS (enabled / disabled) & Destination. This information will be used to track and proximate the situation of the vehicle in RVS. Speed will be important to understand the system to understand or approximate its future location depending upon the speed. Destination parameter will be used to suggest the substitute path in case the approaching RVS is already flooded.
4. If any vehicle tries to join a RVS which is already congested with the max limit of vehicles allowed, then RVS will communicate with the vehicle to indicate the congestion & request to seek another path / route. It may or may not suggest a substitute path depending up on the availability of destination parameter.
5. The data communication in this model will use RSA encryption technique to make it more secure and safe to implement.

IV. RESEARCH CHALLENGES

In this work, we displayed a novel building design that joins ideas of vehicular digital physical frameworks and cloud figuring. The smooth and blunder free working of such framework represent a few key examination challenges that ought to be tended to keeping in mind the end goal to make it practical. We rundown and examine key examination challenges as takes after

Acceptance and confirmation of savvy autos: The human conduct demonstrating is not restricted to social insurance observing also, state of mind recognition. It is more mind boggling and includes thought process. The right demonstrating of human practices is of most extreme essential in approval and confirmation processor of vehicular digital physical frameworks.

Driver's state and abilities: The revision representation of driver's ebb and flow state while driving decides his security.

Security and protection concerns: The driver's security and security is dependably a testing exploration issue in V-Cloud administrations. This can be managed by actualizing a module with approval what's more, verification functionalities.

V. CONCLUSIONS

Security and protection are imperative viewpoints for the securing and keeping up the trust of clients in VC. Protection measures are obliged to guarantee the VC correspondence and data in the secluded and dependable environment. While security systems are expected to ensure against system dangers. Creating trust connections between a few members is an essential piece of reliable correspondence and processing. As a portion of the vehicles identified with VC may have met already, the proactive undertaking of propelling a crucial trust relationship among vehicles is alluring and conceivable. Hence this paper gives the secure communication method to vehicular cloud computing which prevents the attacks at the time of message transfer.

ACKNOWLEDGEMENT

This work is supported by Smt. Kashibai Navale College of Engineering, Pune under the Savitribai Phule Pune University, Pune. This project work is supported by Dr. A. V. Deshpande, Dr. P. N. Mahalle, Dr. K. N. Honwadkar and under the guidance of Prof. S.S.Barde. This work was jointly supported by Borehole Geophysics Research Laboratory, Karad (Maharashtra), India.
